

# Installation and User Guide

How to install the label program on a new PC and how to use it day to day.

| Part               | What it covers                                      | When                    |
|--------------------|-----------------------------------------------------|-------------------------|
| A. Install         | Python, Git, the program and the printers.          | Once. About 30 minutes. |
| B. Use             | Load a shipment, find boxes, print, mark them done. | Every day.              |
| C. Troubleshooting | Common problems and how to ask an AI for help.      | When needed.            |

## Before you start, have ready

- A PC with **Windows 10 or 11** and an internet connection.
- A **GitHub account**. Send your username to Alejo so he can invite you to the program (it is private).
- The **2 label printers** connected: one for the small labels on each pair, one for the 4x6 box labels.
- The **barcode scanner**, plugged in by USB.
- The **shipment files** (spreadsheet and PDFs). They don't come with the program: Alejo sends them by USB stick, Drive or WhatsApp.

**Stuck?** Along with this PDF there is a file called **AI Context - Shipping Tool.md**. Paste it whole into an AI chat (Claude, ChatGPT) and describe your problem: it contains everything about the program so the AI can walk you through it step by step.

## Part A · Install (only once)

### The easy way: setup.bat

Get the file **setup.bat** from Alejo (WhatsApp, USB stick or Drive) and double-click it. It installs Python and Git if they are missing, downloads the program into **C:\ShippingTool**, shows the printers numbered and asks which one is which, and creates the **Shipping Tool** shortcut on the desktop.

Accept the GitHub invitation first (step 1). It is safe to run it again.

Steps 2 to 7 below are what setup.bat does, in case it has to be done by hand.

### 1 Accept the GitHub invitation

Alejo sends you an invitation to the **TheAle26/Rocoo** repository. It arrives by email: open it and click **Accept invitation**. Without this you can't download the program.

### 2 Install Python 3.13

Go to [python.org/downloads/windows](https://python.org/downloads/windows) and download the **Python 3.13** installer (Windows installer, 64-bit). Use 3.13 even if a newer version is available.

#### On the first screen of the installer:

tick the **"Add python.exe to PATH"** box before clicking **Install Now**. If you forget it, the program won't start.

To check it, open **PowerShell** (Windows key, type *PowerShell*, Enter) and type:

```
python --version
```

It should answer something like **Python 3.13.5**.

### 3 Install Git

Go to [git-scm.com/download/win](https://git-scm.com/download/win), download the installer and click **Next** on every screen without changing anything. To check it, in PowerShell:

```
git --version
```

### 4 Download the program

In PowerShell, copy and paste this line and press Enter:

```
git clone https://github.com/TheAle26/Rocoo.git C:\ShippingTool
```

A browser window opens to sign in to GitHub: sign in with your account and accept. It is remembered; it won't ask again. When it finishes you will have the folder **C:\ShippingTool**.

## 5

### Tell the program which printers to use

First check their exact names. In PowerShell:

```
Get-Printer | Select-Object Name
```

Then open **C:\ShippingTool\printers.json** with **Notepad** (right-click > Open with > Notepad). If it doesn't exist, copy **printers.example.json** and rename the copy to **printers.json**. Replace the names with yours, **copied exactly**:

```
{
  "shoe_printer": "name of the small-label printer (pairs)",
  "big_box_printer": "name of the 4x6 printer (boxes)"
}
```

Keep the quotes, the colons and the comma in the middle. Save with Ctrl+S.

Also set the **paper size** of each printer in Windows: Settings > Bluetooth & devices > Printers & scanners > (the printer) > Printing preferences. **4x6** for the box printer and your label size for the pairs printer. Otherwise the labels come out tiny or cut off.

## 6

### First start

Open the folder **C:\ShippingTool** and double-click **start\_app.bat**.

- A **black window** opens. The first time it takes a few minutes because it installs everything it needs.
- Then the browser opens by itself with the program (**http://127.0.0.1:5000**). If it says “can't reach this page”, wait a few seconds and press **F5**.
- If Windows asks about the **Firewall**, click **Cancel**. Only this PC uses the program.

## 7

### Create the desktop shortcut

Right-click **start\_app.bat** > **Show more options** > **Send to** > **Desktop (create shortcut)**. From now on, open it from the desktop.

### Done, the program is installed.

Every time you open it, it updates itself to the latest version.

## Part B · Using the program

### Starting and stopping

- **Start:** double-click the desktop shortcut. **Don't close the black window** while you work.
- **Stop:** the red **Shut down** button at the top right of the page. Don't close the black window with the X.

### 1 · Load a new shipment (once per shipment)

On the start screen, upload the 3 files (you can drag them in) and click **Upload & Process**:

**Start screen**

|                                                                     |                                                            |                                                                   |
|---------------------------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------|
| <b>1. Shipment Data</b><br>the shipment spreadsheet (.csv or .xlsx) | <b>Big Box Label</b><br>Amazon PDF with the 4x6 box labels | <b>Small Box Label</b><br>PDF with the FNSKU labels for the pairs |
| <b>Continue Work</b>                                                | <b>Upload &amp; Process</b>                                |                                                                   |

Simplified drawing of the screen.

### 2 · Find the box and print

Scan with the barcode scanner, or type the number into the large input field and press **Enter**. The matching boxes appear. On each row:

**Scan screen**

453909

|                                                                                                            |                   |                |                  |
|------------------------------------------------------------------------------------------------------------|-------------------|----------------|------------------|
| <b>Master Box: Box 1 - ARIZONA EVA WHITE 37</b><br>Qty: 12   Label: FBA19QHGW04U000501                     | <b>Shoes (12)</b> | <b>Big Box</b> | <b>Mark Done</b> |
| <b>Master Box: Box 3 - SET ASIDE (NO VA A AMAZON) - BOSTON LEVE OYSTER 43</b><br>Qty: 8   Label: SET ASIDE | <b>Shoes (8)</b>  | <b>Big Box</b> | <b>Mark Done</b> |
| <b>Master Box: Box 4 - BOSTON EVA BLACK 38</b><br>Qty: 12   Label: FBA19QHGW04U000548                      | <b>Shoes (12)</b> | <b>Big Box</b> | <b>Mark Done</b> |

Simplified drawing of the screen.

| Button                | What it does                                                               |
|-----------------------|----------------------------------------------------------------------------|
| <b>Shoes (N)</b>      | Prints N small FNSKU labels, one for each pair in the box.                 |
| <b>Big Box</b>        | Prints the Amazon 4x6 label for that master box.                           |
| <b>Mark Done</b>      | Marks the box as finished. It is saved immediately.                        |
| <b>View Data</b>      | Shows the full shipment table, with finished boxes in green.               |
| <b>Download (CSV)</b> | Downloads the spreadsheet with the finished boxes marked, to send or keep. |

### 3 · Resume a shipment after closing

#### Never upload the files again for a shipment you already started.

If the program was closed or the PC restarted, open it again and click **Continue Work**. In the current version of the program, uploading the files again **erases all progress** (every box goes back to “not done”) without warning.

In newer versions the program resumes the shipment by itself and warns before erasing anything. You can tell because the scan screen says **Start a new shipment** and shows “X of Y done”.

## Birkenstock shipment FBA19QHGW04 (6,747 pairs)

### Files to upload

| Field            | File                                                                                                   |
|------------------|--------------------------------------------------------------------------------------------------------|
| 1. Shipment Data | <b>Birkenstock FBA19QHGW04 - para la app.csv</b>                                                       |
| Big Box Label    | The <b>Amazon 4x6 PDF</b> sent by AGL (586 labels, FBA19QHGW04U000001 to U000586)                      |
| Small Box Label  | <b>Birkenstock FBA19QHGW04 - etiquetas FNSKU (generado).pdf</b> (or the official one, if AGL sends it) |

### How to find the boxes

- Each master box has a **6-digit reference number** written by hand, for example **453909**. Many boxes share the same reference.
- Each box also has a **small label with its box number** (1, 2, 3...).
- **Type the reference** (453909) and press Enter. In the list, find the row with the box number from the small label, and print from that row.
- The **P0468**-style barcode on some boxes **is not used**.
- If a box holds several products, several rows appear with the same box number. Each row has its own Amazon label.

#### Rows marked “SET ASIDE (NO VA A AMAZON)”

“No va a Amazon” means **it does not go to Amazon**. Those boxes are **not labeled and not shipped**: they stay in the warehouse. If you press print on one of them you get an error, and that is expected. There are 58 rows with 524 pairs.

| Destination      | Pairs | Boxes / rows   |
|------------------|-------|----------------|
| Go to Amazon     | 6,223 | 586 box labels |
| Set aside (stay) | 524   | 58 rows        |
| Total            | 6,747 | 27 references  |

## Part C · Troubleshooting

| What happens                                                 | What to do                                                                                                                                                              |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The black window says <i>Python is not installed</i>         | Reinstall Python 3.13 ticking <b>Add python.exe to PATH</b> and restart the PC.                                                                                         |
| The browser says “can’t reach this page”                     | Wait 5 seconds and press <b>F5</b> . Check that the black window is still open.                                                                                         |
| It prints on the wrong printer, or gives a printer error     | Check that the names in <b>printers.json</b> are <b>exactly</b> the ones from <i>Get-Printer</i> (step 5).                                                              |
| The label comes out tiny, stretched or cut off               | Set the right paper size in that printer's Printing preferences (step 5).                                                                                               |
| <i>UPC ... not found</i>                                     | Check the number you typed. For Birkenstock you search by the <b>master box reference</b> (6 digits). In <b>View Data</b> , check that the right spreadsheet is loaded. |
| <i>Page for label ... not found</i>                          | That box label is not in the 4x6 PDF you uploaded, or it is a SET ASIDE row.                                                                                            |
| <i>FNSKU ... not found in PDF</i>                            | The small-label PDF doesn't have that product. Check that it belongs to this shipment.                                                                                  |
| <i>No previous session found</i> when clicking Continue Work | No shipment is loaded yet: upload the 3 files.                                                                                                                          |
| The black window was closed by accident                      | Open the shortcut again and click <b>Continue Work</b> . Don't upload the files again.                                                                                  |
| The scanner doesn't type anything                            | Click inside the large input field ( <i>Shoot barcode here...</i> ) and scan again.                                                                                     |

### If an update fails

Every time you open the program it downloads the latest version. When Alejo publishes a new version, the first time the black window may show a message like “*Your local changes to the following files would be overwritten by merge*”. This is expected and is fixed **only once**. Close the program, open PowerShell and paste these lines one at a time:

```
cd C:\ShippingTool
copy printers.json printers.json.bak
git checkout -- printers.json current_label.png current_big_box_label.png
git pull origin main
copy printers.json.bak printers.json
```

The last line matters: it restores your printer settings. If the error message is different, take a photo of it and send it to Alejo.

### Asking an AI for help

Open the file **AI Context - Shipping Tool.md** in Notepad, copy everything (Ctrl+A, Ctrl+C), paste it into a Claude or ChatGPT chat and below it write what is happening, for example: “*I pressed Big Box and it says Page for label not found*”. If it asks you to run a command, copy back what the window answers. For changes to the program or anything strange: **tell Alejo**.
