

Adapting client spreadsheets with AI

How to turn whatever spreadsheet the client sends into a file the program can load, using an AI chat.

Why this is needed

Every client sends their packing list differently: titles above the headers, other column names, columns in Spanish, totals and notes at the bottom. The program only understands **5 columns with exact names**. Instead of fixing the spreadsheet by hand, you give it to an AI together with a set of instructions, and the AI returns a ready file and checks the numbers for you.

What you need

- The **client's spreadsheet** (.xlsx or .csv) and, if you have it, the **client's email** with the instructions and totals.
- The file **AI Prompt - Adapt a Shipment Spreadsheet.md**. It holds the instructions for the AI; it is in the same folder as this guide.
- An **AI chat that can read and create files**, such as **ChatGPT** or **Claude**. Use the account Alejo tells you to, since the spreadsheet contains client data.

The whole process

	Step	Time
1	Save the client's files in the shipment folder	1 min
2	Open an AI chat, attach the spreadsheet and paste the instructions	2 min
3	Answer the AI's questions	2 min
4	Check the AI's summary (totals and warnings)	2 min
5	Download the file and check it in Excel	3 min
6	Load it in the program and do a test print	5 min

Step by step

1

Save the client's files

Create one folder per shipment, named after the Amazon shipment ID, and save the files there **without changing them**:

```
Documents\Shipments\FBA19QHGWM04\  
├─ 1 client ORIGINAL spreadsheet.xlsx      (never edited)  
├─ 2 spreadsheet FOR THE APP.xlsx          (the AI's file, step 5)  
├─ 3 BOX labels 4x6.pdf  
├─ 4 FNSKU pair labels.pdf  
└─ client instructions email.pdf
```

2

Give the AI the spreadsheet and the instructions

- Open a **new chat** in ChatGPT or Claude. Use a new chat for every shipment.
- **Attach** the client's spreadsheet with the paperclip button. Attach the client's email too, if you have it as a PDF.
- Open **AI Prompt - Adapt a Shipment Spreadsheet.md** with Notepad, press **Ctrl+A** and **Ctrl+C**, then click in the chat, press **Ctrl+V** and send.

You don't need to explain anything else. The instructions tell the AI exactly which format the program needs, which rows to remove and which checks to run. You can write in English or Spanish; it will answer in the same language.

3

Answer the AI's questions

The AI looks at the file and asks a few short questions. It usually suggests an answer; you only confirm or correct it.

It asks	What it means	Example answer
What do you scan or type to find a box?	The value you will enter in the program to find a box.	"The 6-digit number written on the master box, it's the Pallet Salida column." / "The barcode on the shoe box."
How is each box identified?	What you see on the physical box, so each row gets a clear title.	"Each box has a small sticker with its box number, column BOX O."
Which rows go to Amazon?	Rows with no Amazon label stay in the warehouse (set aside).	"Yes, the ones without an Amazon label stay here."
What totals did the client give you?	Used to check nothing was lost or duplicated.	"6,747 pairs, 6,223 go to Amazon in 586 boxes."

4

Check the AI's summary

Before giving you the file, the AI shows a summary like this:

```
Rows kept: 644 (removed 6: totals, blank rows, footer notes)
Units: total 6747 | to Amazon 6223 | set aside 524
Amazon box IDs: 586 | set-aside rows: 58
Warnings: none
```

Compare the totals with the client's email. They must match exactly. If they don't, **don't use the file**: tell the AI, and if it still doesn't match, ask the client or Alejo.

Warning	What to do
Totals don't match	Stop. Ask the client which number is right.
An Amazon box ID is used on several rows	Normal if one box holds several products. Confirm it with the AI.
Rows go to Amazon but have no FNSKU	Ask the client for the missing FNSKUs before starting.
Quantity empty or not a number	Ask the client. The program can't load a row without a quantity.

5

Download the file and check it in Excel

Download the file the AI gives you and save it in the shipment folder as **2 spreadsheet FOR THE APP.xlsx**. Don't overwrite the original. Open it and check:

- ☐ Row 1 has these headers, spelled exactly like this: **UPC/EAN (GTIN) · Master Box # · Quantity · FNSKU · Amazon Labels**. Other columns after them are fine.
- ☐ There is no title above the headers and no totals or notes at the bottom.
- ☐ Codes look like normal numbers (**198605562976**), not like **1.98606E+11**.
- ☐ Rows that don't go to Amazon say **SET ASIDE**.
- ☐ Pick 3 rows at random and compare them with the original: same box, same product, same quantity.

Don't "Save as CSV" from Excel

Upload the **.xlsx** exactly as the AI gave it to you. A CSV saved by Excel can use ; as the separator, and the program can't read that.

6

Load it in the program and do a test print

- In the program: **1. Shipment Data** = the AI's file; **Big Box Label** = the 4x6 box labels PDF; **Small Box Label** = the FNSKU labels PDF. Then **Upload & Process**.
- Type or scan one value, for example **453909**. Its boxes must appear.
- Print one **Big Box** label and check that the printed FBA...U000... number is the one on the row.
- Print a few **Shoes** labels and scan one with the barcode scanner into Notepad: it must type the FNSKU.

Never upload files over a shipment that is already in progress.

If the client sends a corrected spreadsheet halfway through, press **Download (CSV)** first to keep the progress, and ask Alejo. Uploading again erases which boxes are done.

What the conversation looks like

You

[attaches VCA PL BIRKENSTOCK 6747.xlsx] [pastes the instructions]

AI

The header is on row 2, and there are totals and notes at the bottom that I will remove. Three questions:

1. What do you type to find a box? I think it's the 6-digit **Pallet Salida** number (e.g. 453901).
2. Each box is **BOX O** inside that pallet, correct?
3. Rows without an Amazon label (58 rows) are set aside, correct?

You

Yes to all three. The email says 6,747 pairs, 6,223 go to Amazon.

AI

Done. 644 rows kept, 6 removed. Total 6,747, to Amazon 6,223, set aside 524, so it matches the email. 586 Amazon box IDs. No warnings.

Download: Birkenstock FBA19QHGW04 - for the app.xlsx

In the program, type the number written on the box (e.g. 453909) and press Enter.

If something goes wrong

What happens	What to do
The AI says it can't create files	Ask it for step-by-step Excel instructions instead (it knows how), or try ChatGPT or Claude with file uploads enabled, or send the spreadsheet to Alejo.
The AI changed quantities or codes	Don't use that file. Tell it: "Don't change any code or quantity, copy them exactly."
After Upload & Process the page says <i>Internal Server Error</i> , or <i>Error processing files</i> and a column name	A header is missing or misspelled, or a row has no quantity. Show the AI the error and your file and ask it to fix it. Then open the program again and upload the fixed file.
Typing the number gives <i>UPC ... not found</i>	The AI used the wrong column as the search value. Tell it what you type and ask for the file again.
<i>Page for label ... not found</i> when printing Big Box	The box ID in the spreadsheet isn't in the 4x6 PDF: wrong PDF, or a SET ASIDE row that doesn't get a label.
The boxes appear in a strange order	Ask the AI to sort the rows (for example by pallet and then by box number).
